WORK SAMPLE · NUVE HOME · APRIL TO OCTOBER 2026

Building an AI SDR system, then starting the rollout to my team

As an SDR at Nuve Home, I booked demos with owners, CEOs and sales directors at HVAC, plumbing and electrical contractors. The job had more required steps than hours in the day, so I built a system in Claude that did the admin around every call. Then I pushed to get the rest of the team access to it, and laid out how to roll it out.

William Arana · Santa Ana, CA · william_arana@yahoo.com · linkedin.com/in/williamarana

117
demos set in six months, 84 held (79% show rate)

#2 of 9
SDRs in October 2026 for demos set (38) and held (28)

26 → 39
monthly demo sets after the SDR team was cut in half

$91K
closed won from 5 deals my demos produced

What I built

- 10 custom skills (step-by-step playbooks Claude follows) connected to 8 apps: HubSpot, Nooks, Apollo, Gmail, Google Calendar, Google Drive, Slack and Krisp
- Two scheduled runs every weekday: a 5:55 AM morning brief and a 3:30 PM end-of-day report
- One live Day Board that ran my whole workday from one screen
- Personalized prospect pages and logo mockups for every account
- Approval rules so nothing important changed in the CRM without me

How I started the rollout

- Pushed leadership for Claude access when the company didn't have it connected to HubSpot
- Joined a 4-person pilot group and worked through every permission option with my manager and the sales director
- Ran the system daily as the pilot rep and logged every mistake and fix
- Compiled a 108-page AI Champions guide and a 13-page quick start guide, and created a slide deck to present the rollout
- Handed the full system and guides to the sales director when I left

About this document

Every screenshot here comes from a demo copy I rebuilt with made-up contractors, contacts, phone numbers and notes. No customer data, internal IDs or company figures beyond my own results are included. Live demos: **william-arana.github.io/work-samples**

THE PROBLEM

An SDR day has more required steps than hours

Every dial came with admin attached. Doing it by hand meant less time on the phone, and skipping it meant AEs walked into demos without context and accounts quietly fell off my book.

75+
dials a day, minimum

2 to 3
touches per account

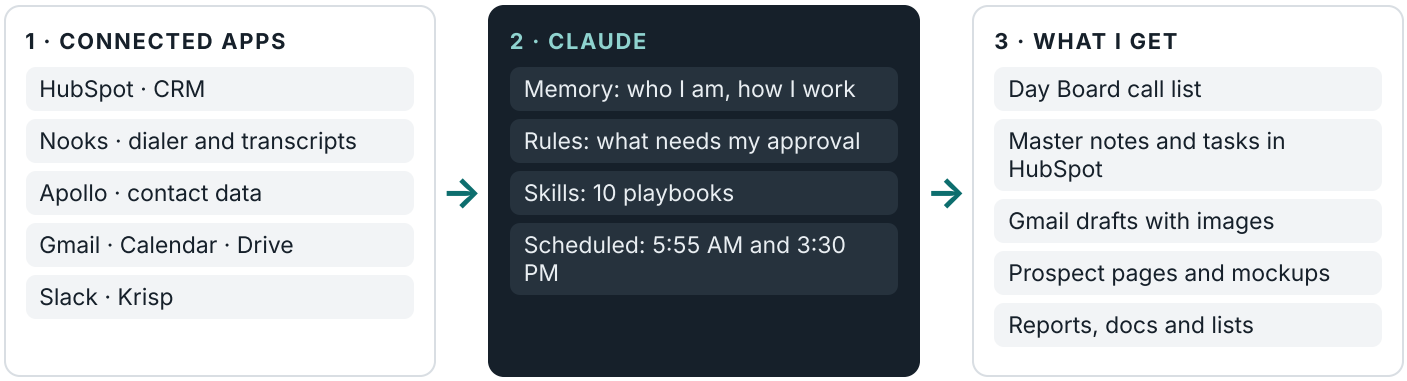

~400
accounts in my book

30 days
to touch an account or lose it

TASK	BY HAND	WITH THE SYSTEM
Build the day's call list	Filter CRM views, check each account, sort by time zone	~80-dial list built before I sat down, in time-zone blocks, with an angle for every account
Know the account before dialing	Scroll old calls, notes and emails	One master note per account, open next to the call list
Log what happened	Write a note, pick a task queue and date	Type what happened once; the note, follow-up task and next callback are written for me
Catch dialer mislogs	Rarely noticed	Flagged every day with the evidence
Send the follow-up	Hunt for assets and write from scratch	A Gmail draft matched to what the decision maker asked for, ready to review
Keep the book alive	Spot 30-day lapses from memory	Accounts 20 to 30 days out are flagged and put on the list
Name-drop nearby customers	Search a spreadsheet mid-call	One button returns the two closest customers

THE ARCHITECTURE

Your apps feed Claude, Claude follows your playbooks, you get finished work

> When something broke, I found the layer first: a wrong ID was a reference problem, a bad call list was a skill problem, a stalled run was an automation problem, a missing record was a data problem.

THE SKILLS

Ten playbooks, each with one job

A skill is a recipe card Claude follows the same way every time. Instead of explaining my process in every chat, I wrote it down once: which queues, which fields, my note format, my tone. A short command runs the whole thing.

SKILL	I TYPE	WHAT IT DOES
morning-brief	`/morning-brief`	Checks my demo pace, finds email clicks and due tasks, refreshes the master note on every account, builds an ~80-dial list in time-zone blocks and publishes it to the Day Board. Runs on its own at 5:55 AM.
eod-report	`/eod-report`	Reviews every call and transcript, flags mislogs, writes dated master-note lines, closes call-list tasks, sets follow-ups with the right queue and timing, and lists anything that needs my approval. Runs at 3:30 PM.
sdr-shared	`fix the board`	The shared rulebook both runs use: how the Day Board is built and the Hot / Warm / Cold lead label rule.
follow-up	`/follow-up [name]`	Pulls the call notes, matches what the decision maker asked for to the right marketing assets, and drafts the Gmail with images inline. Never sends.
sdr-notes	transcript + `SDR Notes`	Turns a call transcript into a paste-ready CRM note for the AE: pain, objections, what I pitched, open items and the angle to lead the demo with.
research-notes	`/research-notes`	Turns pre-call research into the same note format, with the source of every finding and the dead ends recorded.
prospect-page	`/prospect-page`	Builds a personalized mobile page with the contractor's logo on the product, plus a ready-to-send text.
nuve-prospect-page	`/nuve-prospect-page`	The team version of the same page, set up so any rep could use it for their own accounts.
mock-up	`/mock-up` + logo	Puts a contractor's logo on the product and app template and hands back an image for emails.
nearest-contractor	`CC [city]`	Returns the two closest existing customers to name-drop on a call.

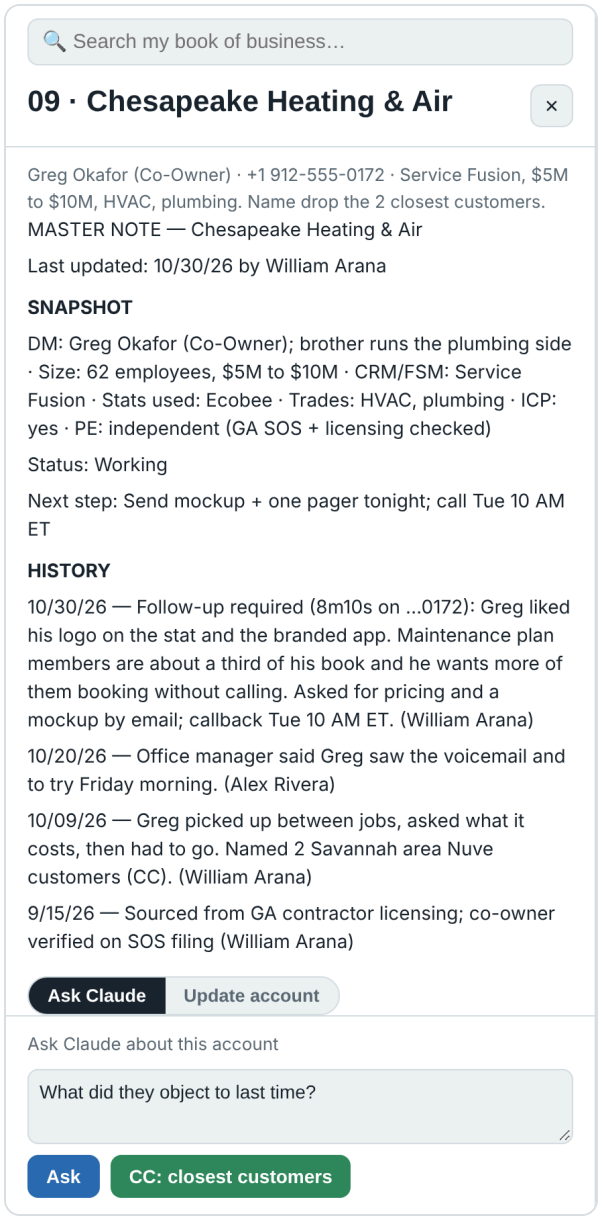

Eight design principles

- **Start from real pain.** Build for a task someone does every day, not a demo.
- **One job per skill.** Small skills beat one giant prompt.
- **Write rules down.** If I said it twice, it belongs in a skill.
- **Approve what's costly to undo.** Low-risk notes run; deal fields and labels wait.
- **One place to look.** Every run lands on the same board.
- **Safe to re-run.** Running twice never doubles anything.
- **Name the sources.** Say which source wins when they disagree.
- **Ask, don't guess.** Uncertain items become questions, not silent errors.

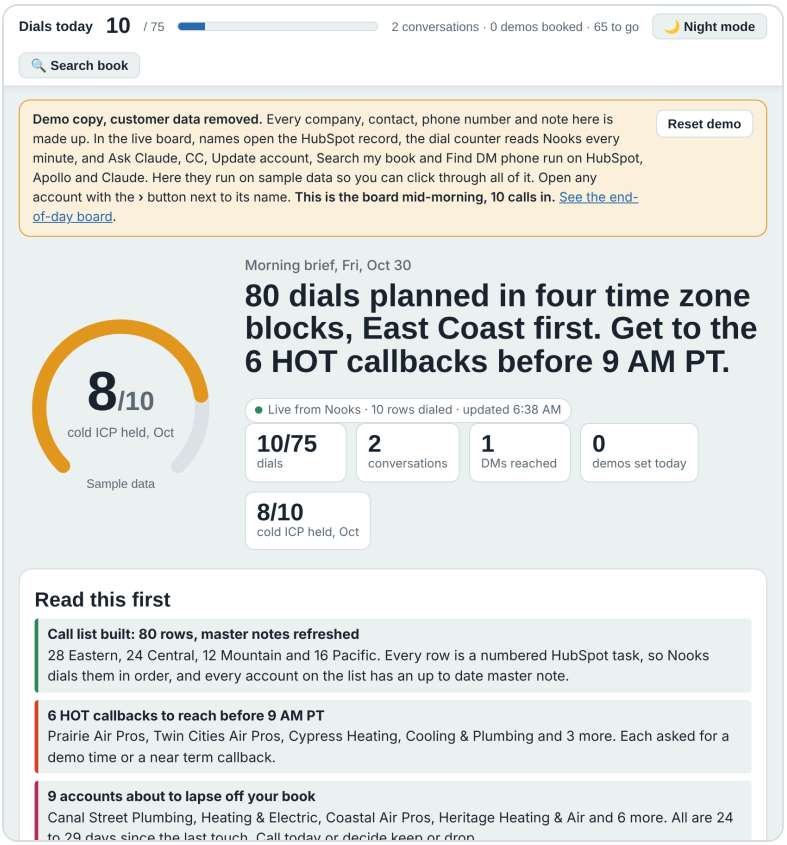

THE DAY BOARD · DEMO COPY

My whole workday on one screen

The morning brief built the board before I sat down. I opened the same link on my laptop and phone, and I never had to leave it to get the work done.

The account panel: the master note with a snapshot and a dated history naming who made each touch, plus Ask Claude and the CC button.

Top of the board mid-morning: the day's plan in one sentence, live dial tracking, and the monthly pace check.

How a call worked

1. Pick the next numbered row and dial it in Nooks.
2. While it rings, read the master note and hit CC for the two closest customers.
3. Run the call, typing notes into Update account as I go.
4. Send it: the master note, follow-up task and next callback are written to the CRM.

Each account took a couple of minutes instead of the 5 to 10 it used to.

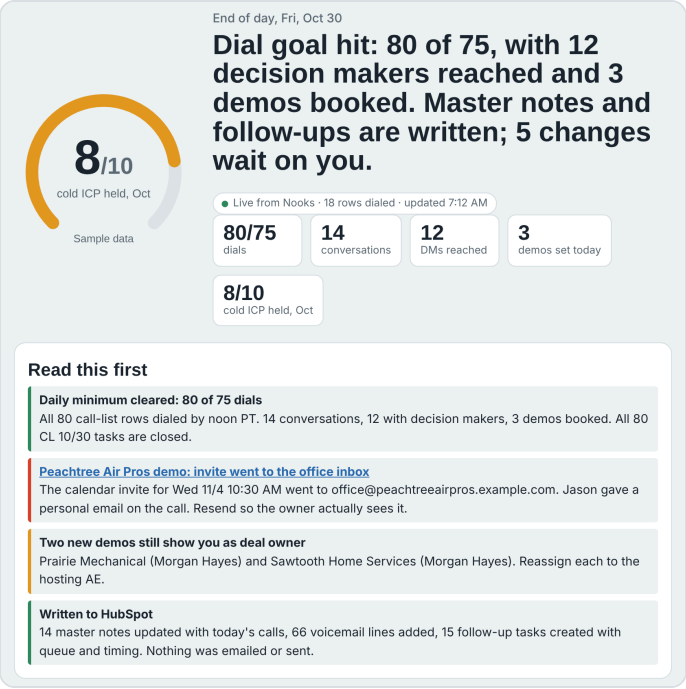

CALL LIST AND END OF DAY · DEMO COPY

Every row has a reason, and every call lands correctly

7:45–9:30 Central block

	#	Company	Contact	Phone	Local	Bucket	Why / angle	Remove
☐	29	Lone Star HVAC › Dallas, TX	Luis Yates (General Manager)	+1 214-555-0138	CT	COLD	Jobber, $2M to $5M, HVAC, light commercial. Ask how they keep members from price shopping.	×
☐	30	Riverbend Home Services › Oklahoma City, OK	Victor Callahan (General Manager)	+1 405-555-0171	CT	COLD	ServiceTitan, $10M to $25M, HVAC. Branded app with their logo; send mockup after.	×
☐	31	Prairie Air Pros › Austin, TX	Brandon Mercer (Owner)	+1 512-555-0191	CT	HOT	Brandon asked for a demo time last week. Get it on the calendar today.	×
☐	32	Prairie Heating & Air › Tulsa, OK	Hector Pruitt (General Manager)	+1 918-555-0155	CT	EXPIRING	25 days since last touch. Call or decide keep / drop.	×
☐	33	Pecan Grove Climate Control › Tulsa, OK	Marcus Ferraro (Owner)	+1 918-555-0151	CT	COLD	ServiceTitan, $10M to $25M, HVAC. Ask how they keep members from price shopping.	×

The call list: rows grouped by time block with the contact, phone, local time zone, Hot / Warm / Cold bucket and the angle to open with. Every row is a numbered CRM task, so the dialer calls them in order.

The 3:30 PM report: the day in one sentence and the flags that need action first.

What the end-of-day run did

- Pulled every call from the dialer and the CRM, plus transcripts
- Checked each logged outcome against what was actually said
- Added a dated line to every master note it touched
- Closed the day's call-list tasks and their linked follow-ups
- Created follow-up tasks with the right queue and timing
- Proposed deal field and lead label fixes for my approval

First full day with the finished system

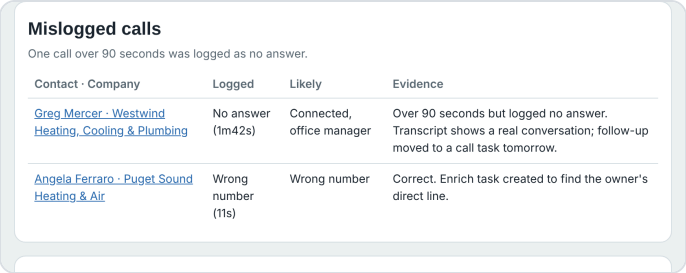

In about four hours: 45 dials, 8 conversations, 7 decision makers reached and 3 demos booked.

GUARDRAILS · DEMO COPY

Nothing important changed until I said so

Speed only helps if the data stays clean. I set approval tiers so routine writes ran on their own and anything costly to undo waited for me.

CHANGE	WHO DECIDES	WHY
Master notes and follow-up tasks	Pre-approved	History is append-only, so nothing is lost
Deal fields and lead labels	Needs my OK	They drive reporting, queues and priority
Company and contact edits	I make them	Shown as a change list; I fix them by hand
Sending email or Slack messages	Never alone	Drafts only; a human reads every outbound message

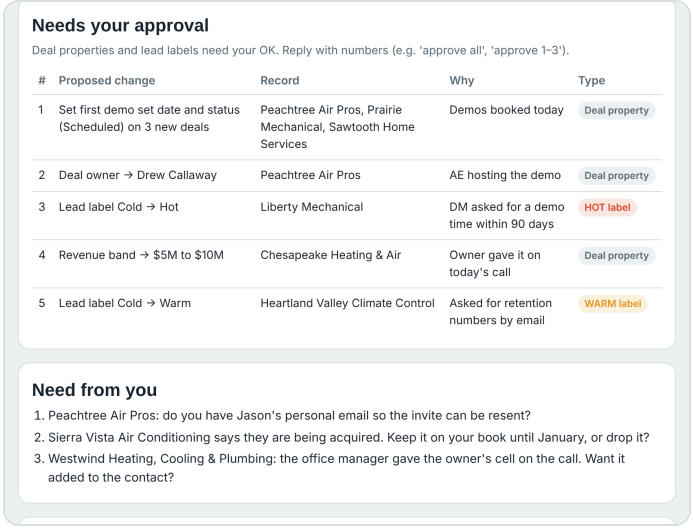

Mislogged calls

One call over 90 seconds was logged as no answer.

Contact · Company	Logged	Likely	Evidence
Greg Mercer · Westwind Heating, Cooling & Plumbing	No answer (1m42s)	Connected, office manager	Over 90 seconds but logged no answer. Transcript shows a real conversation; follow-up moved to a call task tomorrow.
Angela Ferraro · Puget Sound Heating & Air	Wrong number (11s)	Wrong number	Correct. Enrich task created to find the owner's direct line.

The mislog check: the dialer often logged real conversations as no answer. Calls over ~90 seconds logged as no answer, and transcripts showing a real conversation, get flagged so follow-ups stay accurate.

Needs your approval

Deal properties and lead labels need your OK. Reply with numbers (e.g. 'approve all', 'approve 1–3').

#	Proposed change	Record	Why	Type
1	Set first demo set date and status (Scheduled) on 3 new deals	Peachtree Air Pros, Prairie Mechanical, Sawtooth Home Services	Demos booked today	Deal property
2	Deal owner → Drew Callaway	Peachtree Air Pros	AE hosting the demo	Deal property
3	Lead label Cold → Hot	Liberty Mechanical	DM asked for a demo time within 90 days	HOT label
4	Revenue band → $5M to $10M	Chesapeake Heating & Air	Owner gave it on today's call	Deal property
5	Lead label Cold → Warm	Heartland Valley Climate Control	Asked for retention numbers by email	WARM label

Need from you

1. Peachtree Air Pros: do you have Jason's personal email so the invite can be resent?
2. Sierra Vista Air Conditioning says they are being acquired. Keep it on your book until January, or drop it?
3. Westwind Heating, Cooling & Plumbing: the office manager gave the owner's cell on the call. Want it added to the contact?

"Needs your approval": every proposed change is numbered with the record and the reason. I replied "approve all" or "approve 1 to 3."

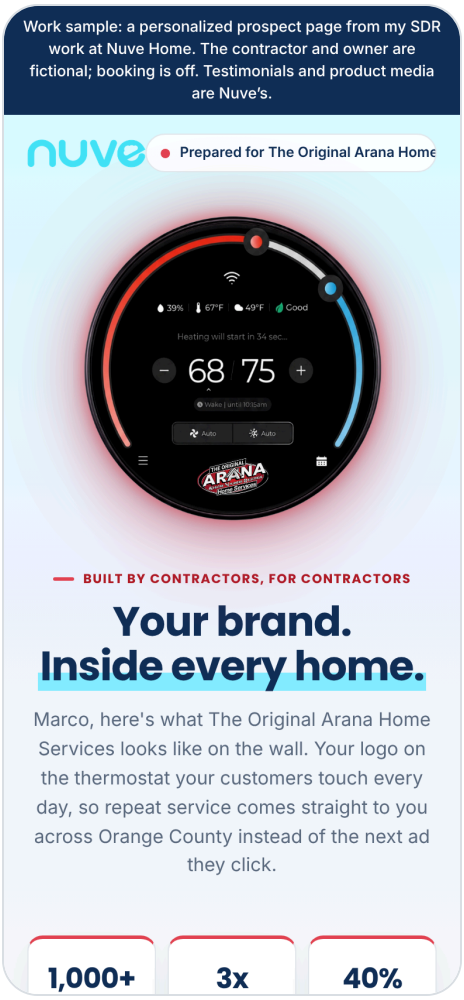

Lessons learned the hard way

WHAT WENT WRONG	WHAT I CHANGED
The dialer logged real conversations as "no answer"	Daily mislog check comparing duration, transcript and outcome
Call recap emails misspelled contact names	Recaps became a backup source only; names never copied from them
Leads with a placeholder company landed on catch-all records	A known catch-all list that every skill skips
The CRM connector couldn't edit companies or contacts	Every run ends with a "changes for you to make" list
Scheduled runs kept old rules after approvals changed	Review the scheduled prompts whenever standing approvals change
Risk of a second, out-of-date board	One board, one link, written into the shared rules

PROSPECT PAGES, MOCKUPS AND SOURCING · DEMO COPY

Their brand on the product before the demo

I never pitched a thermostat. I pitched retention and revenue: the contractor's logo on the device their customers touch every day. So before a call or right after one, I sent each owner a page that showed exactly that.

A demo prospect page built for a made-up contractor.

How a page got made

1. Drop in the contractor's logo and type `/prospect-page`.
2. A script puts the logo on the thermostat face and the phone app.
3. The page is built with their company name and service area, then published.
4. I get the link and a ready-to-send text with a link preview.

Built for the team, not just me

I made a team version of the page builder so other SDRs could create pages for their own accounts, and wrote a proposal to trigger it from a CRM note so any rep could get a page back in Slack without leaving their workflow.

Logo mockups

The same logo placement as a standalone image, dropped into follow-up emails as the hero image so the decision maker saw their brand first.

Sourcing and research tools

- **Sourcing extension.** A Chrome extension on an HVAC contractor directory that checked whether a company was already in the CRM, scored its fit and linked its state filing and license records.
- **Ownership screening.** Checked Secretary of State filings and registered agents to separate PE-backed groups from independents before I dialed.
- **Automation proposal.** A written setup spec so any rep could type `/prospect-page` on a CRM note and get a branded page back in Slack, using read-only, least-privilege access. Proposed, not shipped.

Why it mattered

It turned a cold call into something the owner could picture, and it gave the AE a demo that started from the prospect's own brand.

STARTING THE ROLLOUT

From one rep's setup to a plan for the whole team

A tool only one person uses doesn't change much. Once the system was working for me, I put the pieces in place so the rest of the SDR team could use it safely.

Made the case for access
Claude wasn't connected to the company's CRM. I pushed leadership for access and championed it internally.

Joined the pilot group
We were given early access as a 4-person pilot group: me, a Claude and operations lead, and two Account Executives who were also pushing for access. We went through every permission option with my manager and the sales director so nothing reached the whole team that shouldn't, and helped build the case for company-wide access.

Ran the system as the pilot rep
I used it every day on my own book, logged every mistake, and turned each fix into a rule in the right skill.

Packaged it so someone else could rebuild it
I compiled a 108-page AI Champions guide covering the architecture, lessons learned, governance, metrics and the rollout plan, plus a 13-page quick start guide to set up one rep step by step. I separated shared settings from personal ones so a new rep only changed a handful of values.

Created the rollout deck
I created a slide deck to present the rollout plan to the team and leadership.

Handed it off
When I left at the end of October 2026, I gave the full system, both guides and the export files to the sales director so the team could pick up the rollout.

What changes per rep, and what stays shared

Shared across reps (set once)

- CRM queues, deal property names and values
- Marketing asset library and mockup template
- Customer list for name-drops
- Lead label rule and AE booking link

Personal (set per rep)

- Name, CRM owner and daily call-list segment
- Their own Day Board and briefs folder
- Personal booking link, phone and email
- Work hours and call blocks

What I handed over

108
page AI Champions guide: architecture, lessons, governance, metrics and the rollout plan

13
page quick start guide to set up one rep step by step

1
rollout slide deck for the team and leadership

10
skill folders with their references, templates and scripts

2
scheduled runs with their full prompts

1
written spec for the proposed prospect page automation

THE ROLLOUT PLAN

Three phases, each with a clear gate

Phase 0 · Pilot

1 rep (me)

- Run it daily for 2+ weeks
- Log every mistake and fix it in the skill
- Capture baseline metrics

Move on when: the brief and end-of-day report are trusted without line-by-line checks

Phase 1 · Small group

2 to 3 reps

- Move personal values into settings
- Quick start setup per rep
- Weekly 30-minute review

Move on when: each rep runs the brief and end-of-day report daily for 2 weeks

Phase 2 · Team

All SDRs

- Shared skills provisioned for everyone
- Standard connector permissions
- Office hours and a champion per pod

Move on when: metrics hold or improve against the baseline

A one-hour onboarding session

TIME	WHAT
0:00 to 0:10	Why: the SDR workload and one real Day Board
0:10 to 0:20	Basics: how to ask, and the six words to know
0:20 to 0:40	Set up together: apps, skills and memory
0:40 to 0:50	First run: the morning brief, then open the board
0:50 to 0:55	Quick wins: CC, a mockup, a follow-up draft
0:55 to 1:00	Next day: first end-of-day approval side by side

Teaching colleagues who are new to AI

Start with one quick win
CC plus their next prospect's city, a mockup with a prospect's logo, or seeing their own Day Board.

Then build the habit
Pair on the first end-of-day approval, share the cheat sheet, and celebrate the first mislog it catches.

Answer the common worries
"Will it send things on its own?" No, drafts only. "What if it's wrong?" It asks, and you approve. "It's more work." Measure it against last week.

Questions champions get asked

QUESTION	SHORT ANSWER
Can it send emails or texts on its own?	Not in this setup. It drafts; the rep sends.
What stops it writing bad data to the CRM?	Approval tiers, full master-note history, and questions instead of guesses.
Does it work on a phone?	Yes. The board, chats and notifications all work on mobile.
Can two reps share one board?	No. One board per rep; each skill copy points to its own.
What if CRM fields or queues change?	Update the IDs in each skill's reference file once; every run picks it up.
What happens when a rep leaves?	Delete their scheduled runs, disconnect their apps and archive their board.

GOVERNANCE AND MEASUREMENT

Keeping a team rollout safe, and proving it works

Approval tiers everywhere
The same three tiers in every rep's setup: runs alone, asks first, or the rep does it.

Outbound stays human
No skill sends email or texts by itself. Sending is set to need approval or blocked.

Skill ownership
One owner per skill, a short change log, and a monthly review of rules and record IDs.

Credit budgets
Agreed limits on paid data lookups per rep, with the cost shown before any spend.

Sensitive data
No ID or card numbers in chats or notes, and personal details from people-search sites stay out of the CRM.

Offboarding
Delete scheduled runs, disconnect apps and archive the rep's board when they leave.

Risks and how they're handled

RISK	LIKELIHOOD	MITIGATION
Wrong data written to the CRM	Medium	Approval list for deal fields and labels; master notes keep full history; questions instead of guesses
Email to the wrong person or with wrong facts	Low	Drafts only; facts limited to the asset library and the record
Data credits overspent	Low	Cost shown before spending; one pre-approved button
Record IDs go stale after CRM changes	Medium	IDs kept in one reference file per skill; monthly review
A scheduled run quietly does less	Medium	Check last-run status; review prompts when rules change
Reps stop checking the output	Medium	Daily "need from you" questions; spot-check created tasks

What to measure before and after

- Dials per day
- Conversations and decision makers reached
- Cold demos held per month
- Accounts lapsing past 30 days
- Accounts with a current master note
- Mislogged calls caught per week
- Minutes per day on admin (self-reported)
- Baseline from the pilot, then after 30 days

Start with one rep. Write every lesson into a skill. Then hand it on. That's how I built it, and it's how I'd help build the next team's outbound engine.
